Overview:

The following pages include codebooks describing all variables included in the three data files. For additional information and full experimental condition text and questionnaires, see the article and its online appendix.

Contents:

1. follower_combined.dta	pg. 2
2. leader_combined.dta	pg. 4
3. demographic_data.dta	pg. 6

follower_combined.dta

This data file includes all follower decisions. Each follower made a guess and contribution decision five times, once for each possible message sent by the leader. The data are in a long format. Below are short descriptions of each included variable.

message The message sent by the leader, recoded from 1 (80 tokens) to 5 (400 tokens).

contribution The contribution made by the player, recoded from 1 (0 tokens) to 6 (100 tokens).

guess The player's guess of the true threshold, recoded from 1 (80 tokens) to 5 (400 tokens).

ID A unique identification number for each participant.

com_1_f The players' response to the first comprehension question (which is unique to the followers).

comp_2 The players' response to the second comprehension question (which is the same for leaders and followers).

comp_3 The players' response to the third comprehension question (which is the same for leaders and followers).

winner Whether the group met (1) or failed to meet (0) the actual threshold chosen for subject payment.

real_t The threshold used for subject payment, in tokens.

real_m The message used for subject payment, in tokens.

lab Whether a player was recruited through the lab (1) or MTurk (0) sample.

keep Whether a player was in the inefficiency (1) or control (0) condition.

corr_1 Whether a player correctly (1) or incorrectly (0) answered the first comprehension question.

corr_2 Whether a player correctly (1) or incorrectly (0) answered the second comprehension question.

corr_3 Whether a player correctly (1) or incorrectly (0) answered the third comprehension question.

total_comp The number of comprehension questions a player answered correctly.

all_right Whether a player answered all comprehension questions correctly, (1) all correct or (0) at least one question incorrect.

long_message The message sent by the leader in tokens.

long_contribution The contribution the player made to the threshold in tokens.

long_guess The player's guess of the true size of the threshold in tokens.

long_guess_dis The distance between the players' guess of the threshold size and the message sent by the leader, in tokens.

guess_dis The distance between the players' guess of the threshold size and the message sent by the leader, rescaled such that `long_guess_dis` is divided by 80. Note that guesses could only be made in increments of 80, so one unit is one response option farther from the message sent by the leader.

believe Whether the player guesses the threshold is equal to the message sent by the leader (1) or different from the message sent by the leader (0).

symmetric Whether a player contributed their fair share to the message sent by the leader (1) or made a different contribution (0).

less_symmetric Whether a player contributed less than their fair share to the message sent by the leader (1) or made a different contribution (0).

more_symmetric Whether a player contributed more than their fair share to the message sent by the leader (1) or made a different contribution (0).

prop_symmetric The proportion of their fair share contribution a player contributed to the threshold. This variable is calculated as their contribution in tokens divided by the fair share contribution for the message sent by the leader.

keep_title A string variable containing the name of the condition the player was in (inefficiency or control).

message01 The message sent by the leader, rescaled from 0-1.

interact01 An interaction between `message01` and the respondents condition (keep).

real_t01 The real threshold used for participant payment, rescaled from 0-1.

real_m01 The real message sent by the leader used for participant payment, rescaled from 0-1.

leader_combined.dta

This data file includes all leader decisions. Each leader sent a message five times, once for each possible value of the actual threshold. The data are in a long format. Below are short descriptions of each included variable.

real_threshold The cost of the threshold, recoded from 1 (80 tokens) to 5 (400 tokens).

message The message sent by the leader, recoded from 1 (80 tokens) to 5 (400 tokens).

guess The leaders' guess of how much the followers will collectively contribute, in tokens.

ID A unique identification number for each participant.

comp_1_1 The players' response to the first comprehension question (which is unique to the leaders).

comp_2 The players' response to the second comprehension question (which is the same for leaders and followers).

comp_3 The players' response to the third comprehension question (which is the same for leaders and followers).

winner Whether the group met (1) or failed to meet (0) the actual threshold chosen for subject payment.

lab Whether a player was recruited through the lab (1) or MTurk (0) sample.

keep Whether a player was in the inefficiency (1) or control (0) condition.

corr_1 Whether a player correctly (1) or incorrectly (0) answered the first comprehension question.

corr_2 Whether a player correctly (1) or incorrectly (0) answered the second comprehension question.

corr_3 Whether a player correctly (1) or incorrectly (0) answered the third comprehension question.

total_comp The number of comprehension questions a player answered correctly.

all_right Whether a player answered all comprehension questions correctly, (1) all correct or (0) at least one question incorrect.

long_message The message sent by the leader in tokens.

long_t The cost of the threshold in tokens.

long_mess_dis The distance between the message sent by the leader and the true cost of the threshold, in tokens.

lab_long_mess_dis The distance between the message sent by the leader and the true cost of the threshold in tokens in the lab sample.

turk_long_mess_dis The distance between the message sent by the leader and the true cost of the threshold in tokens in the MTurk sample.

demographic_data.dta

This data file includes demographic information on each respondent.

Age The age of each respondent.

Gender The gender of each respondent, (1) Man (2) Woman (3) Other.

race The race or ethnicity of each respondent, (1) Asian (2) Black (3) Hispanic-Latino (4) Native American (5) White (6) Other

race_6_TEXT If a respondent selected (6) Other for the race question, they then input text with their preferred race/ethnicity here.

PartyID Respondent party identification, (1) Republican (2) Democrat (3) Independent (4) Other.

idlgy Respondent ideology on a 7-point scale, with 1 being most liberal and 7 most conservative.

lab Whether a player was recruited through the lab (1) or MTurk (0) sample.

education The highest level of education a player has completed, (1) High school or equivalent, (2) Vocational/Technical school, (3) Some college (4) College graduate (5) Master's Degree (6) Doctoral Degree (7) Professional Degree. Note this variable will be missing for all lab sample participants – all players recruited in the lab were current college students.
